### Hot Runners at EuroMold

## Flexible Selection of Standard Hot Runner Products and Systems for as Many as 96 Nozzles per Mould

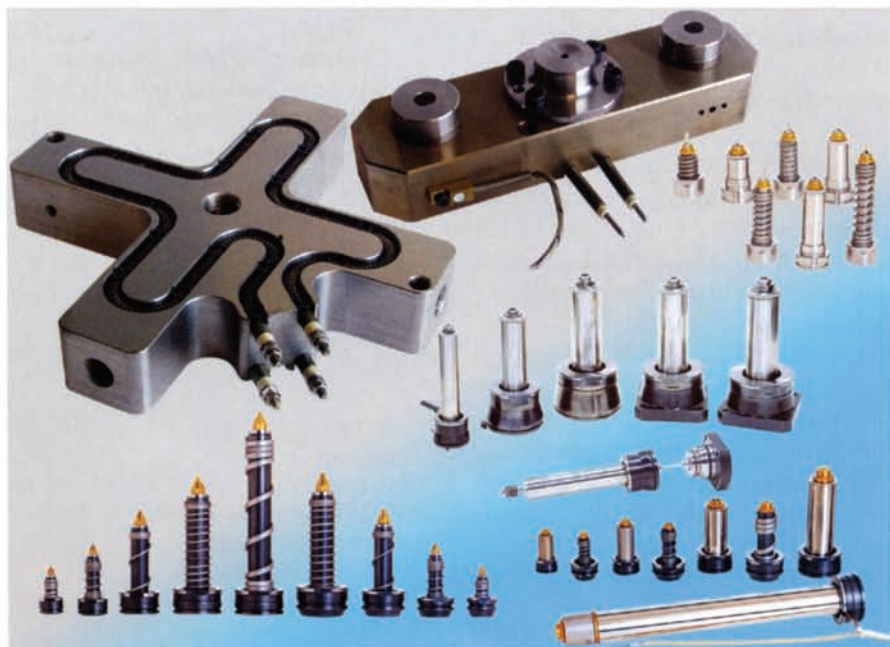

An extended range of standard hot runner products available from DME Europe makes the mould technologies resource a more flexible supplier than ever. DME now offers a solution for almost any application up to 96 nozzles per mould. The new Polimax noz-

zles, for example, come in various lengths between 50 and 500 mm and with shot weight capabilities up to 3,000 g. In addition, the company provides a multitude of different tips so that the type of gate can easily be chosen by changing the nozzle tip.

DME also offers new Polifast nozzles for parts up to 50 g. This range features a variety of tips, just like its big sister the Polimax nozzle, and like the new Policosmetic for use in specific packaging applications.

DME has improved its flexibility with valve gate systems as well as in the open nozzles range. The Polivalve valve gate system allows the operator to choose from a variety of options depending on whether an electric or a hydraulic drive is required, or a pre-installed system or complete hot half. Hot halves are also available for the open-type systems; here, the operator has only to add the cavity plate in order to start production.

Finally, DME has added an economically priced hot runner system to its product line for moulders facing cost-reduction pressures. The new Essential series is a cost-efficient system for standard materials, available in one-, two- and four-nozzle formats.
